Script-Controlled ACL – Restrict Record Access Based on Field Value

Phase 1 - Brainstorming & Ideation

Purpose: Define the project idea, identify the record-access control problem, and propose a script-controlled ACL solution.

Section Details

Project Idea	Control access to ServiceNow records dynamically using a scripted Access Control List (ACL) that checks a field value before allowing users to read or access the record.
Problem Identified	Standard role-based access may not be sufficient when record visibility depends on specific field values. Without a field-based condition, users may gain access to records they should not see.
Proposed Solution	Create a Script-Controlled ACL that evaluates a selected record field and grants or denies access based on its value. This provides dynamic, field-level record access control and improves security.
Expected Outcome	A secure and traceable record-access mechanism where users can access records only when the required field value and access conditions are satisfied, reducing unauthorized record visibility.

Project Note: This phase document is prepared for organizing the TN Skills project evidence and can be supplemented with your actual ServiceNow ACL, script, table, field-value conditions, and configuration screenshots.
