Script-Controlled ACL – Restrict Record Access Based on Field Value

Phase 2 - Requirement Analysis

Purpose: Identify the functional and non-functional requirements of the script-controlled record access project.

Section Details

Functional Requirements	Create and configure a Script-Controlled ACL, identify the field value used for access control, evaluate the field value through the ACL script, allow authorized access when the required condition is satisfied, and deny access when the condition is not satisfied.
User Requirements	Users should be able to access records only when they satisfy the defined field-value access condition. Unauthorized users should be prevented from viewing or accessing restricted records.
Admin Requirements	Administrators should be able to configure and manage the ACL, define the field-value condition, maintain the script logic, manage user roles and permissions, and test the access behavior.
Non-Functional Requirements	The access-control process should be reliable, secure, maintainable, consistent, and provide predictable access behavior without unnecessarily affecting authorized users.

Project Note: This phase document is prepared for organizing the TN Skills project evidence and can be supplemented with your actual ServiceNow ACL, table, field-value condition, script logic, user roles, and configuration screenshots.
