Script-Controlled ACL – Restrict Record Access Based on Field Value

Phase 4 - Development / Implementation

Purpose: Implement the designed record-access control using a ServiceNow Script-Controlled Access Control List (ACL).

Section Details

Platform Setup	Configure the required ServiceNow application, target table, fields, users, roles, and access-control settings needed to implement and test the ACL.
ACL Configuration	Create the required ACL for the target operation and configure the appropriate table, operation, roles, conditions, and security settings.
Script Configuration	Add the script logic that evaluates the selected field value and determines whether the current user is permitted to access the record. Configure the condition so that matching field values allow access and non-matching values restrict access.
Implementation Result	The configured Script-Controlled ACL evaluates record field values and applies the defined access rules, allowing authorized users to access permitted records while restricting unauthorized record access.

Project Note: This phase document is prepared for organizing the TN Skills project evidence and can be supplemented with your actual ServiceNow ACL configuration, script, target table and field, roles, test cases, and screenshots.
