Script-Controlled ACL – Restrict Record Access Based on Field Value

Phase 5 - Testing

Purpose: Verify that the Script-Controlled ACL works correctly under expected record-access scenarios.

Section Details

Functional Testing	Check ACL configuration, field-value evaluation, user-role conditions, script execution, record access, and access denial behavior.
Positive Test	Use a user and record where the required field-value condition is satisfied and verify that the user is allowed to access the record.
Negative Test	Use a user or record where the required field-value condition is not satisfied and verify that the ACL prevents unauthorized record access.
Result	Record test observations, correct ACL or script configuration issues, and repeat the tests until the expected access-control behavior is achieved.

Project Note: This phase document is prepared for organizing the TN Skills project evidence and can be supplemented with your actual ServiceNow ACL test cases, field values, user roles, expected results, actual results, and screenshots.
