Script-Controlled ACL

Restrict Record Access Based on Field Value

Phase 7 - Deployment

Purpose: Prepare the completed Script-Controlled ACL solution for use in the intended environment.

Section Details

Deployment Preparation	Verify the ACL configuration, roles, script logic, field-based access condition, test results, and required data before deployment.
Release	Move or publish the completed Script-Controlled ACL configuration according to the project environment requirements.
Verification	Perform final access tests using records with different field values and confirm that the ACL correctly permits or restricts record access.
Maintenance	Monitor the ACL behavior and update the configuration or script when the protected field, access requirements, roles, or project requirements change.

Deployment Preparation

ACL Configuration: Confirm that the Script-Controlled ACL is configured for the intended table, operation, and field.

Script Logic: Verify that the script correctly evaluates the configured field value and returns the expected access result.

Roles and Access: Verify the applicable roles, users, and conditions required for the ACL.

Testing: Confirm that testing has been completed for both permitted and restricted field values.

Required Data: Verify that the records and field values required for deployment are available in the intended environment.

Release

Move or publish the completed Script-Controlled ACL configuration according to the requirements of the project environment. Ensure that the deployed ACL, associated script logic, and required configuration are available in the target environment.

Verification

• Open a record that should satisfy the configured field-value rule and confirm that access is permitted.

• Open a record that should not satisfy the rule and confirm that access is restricted.

• Verify that the ACL behaves consistently for the intended users and roles.

• Confirm that the final deployed configuration produces the expected access-control behavior.

Maintenance

Monitor the deployed ACL and review its behavior when requirements change. Update the field-based condition, script logic, roles, or related configuration when necessary. Retest the ACL after significant configuration changes to ensure that record access remains consistent with the project requirements.

Deployment Evidence

- Screenshot of the final ACL configuration in the target environment
- Screenshot of the deployed script or scripted condition
- Evidence of successful access for a matching field value
- Evidence of restricted access for a non-matching field value
- Final testing or verification evidence

Project Note: This phase document is prepared for organizing the TN Skills project evidence and can be supplemented with your actual screenshots, configuration details, deployment environment information, and verification results.
